### Notes:

- I've updated the pipeline to work with Project 2 data
- Pipeline has some assumptions about the structure of project 1 data, we can fix this
- Aristeia: expect about 90-100 scans from Einstein for each timepoint
- Toga: how consistent are the lesions across sites and individuals. Make 3D models showing the statistics. (Thought: maybe a 3d model of mean, colored by variance?)
- Craig: Field strength differences? Agilent at 9.4T, higher echo time on T2 scans
- Aristeia: UCLA, Melbourne data incoming?
- Neil: they are collecting data, not yet uploaded
- Staba: about 60 cases available
- Toga: make tables of maps of lesions to share, nail down papers in next couple months
- Aristeia: next zoom in February
- Terry: do primary analysis at LONI and share data for secondary analysis with other sites
- Toga: keep track of noise, artifact, etc.
- Question: can we upload preprocessed results to IDA?

- Aristeia: zoom every two weeks?
