

## **CONSORTIUM – PROJECT 3 – BIOMARKERS FOR HUMAN EPILEPTOGENESIS AFTER TRAUMATIC BRAIN INJURY**

As explained in the EpiBioS4Rx Overall documentation, EpiBioS4Rx is a federated consortium of international research centers organized into an Administrative Core for logistical support, an Informatics and Analytics Core (IAC) for analytic support, which will house a shared database and biobank, a Public Engagement Core for patients and their families, and 3 focused complementary Research Projects. Project 3's protocols have been carefully harmonized with Research Projects 1 and 2.

Dr. Vespa will be PI of Research Project 3 on studies of epileptogenesis using patients with TBI/PTE, in careful continuous coordination with the entire Project leadership team through membership on its Executive Committee. He will serve as the lead investigator for purposes of human studies across all collaborating clinical sites, with local investigators serving as local PI's.
